BashayJabo

Because the best part of IUT is going home

Introduction

Organization:

This system is being developed by an independent startup founded by us. Though not officially a part of the university, the startup is dedicated to serving the IUT student community.

Its core mission is to ease everyday student challenges through innovative digital solutions.

In Scope:

- User registration and authentication
- Ride request and offer posting
- User preferences (e.g., preferred travel-mates, gender preferences)
- Rating and feedback system for rides
- Integration with external ride-hailing services (e.g., Uber, Pathao)
- Payment client

Out of Scope:

- Real-time GPS tracking or live location sharing
- Support for non-IUT users

Use Case Diagram

Management Levels

- **Operational Level:** directly shape system requirements such as usability, ride preferences, cost-sharing, and reliability.
- **Tactical Level:** includes analyzing student data, designing features, and maintaining integration with external transport providers.
- **Strategic Level** (Potential University Admin Involvement): future collaboration with IUT administration may involve data policy, promoting the service, or enabling secure access

Cultural Factors

- **Student Community Norms:** gender sensitivity, safety, and trust, plays a critical role in ride-sharing partner matching.
- **Cost Awareness:** students are cost-conscious, increases interest in shared rides and group discounts on public transport.
- **Digital Readiness:** IUT students are tech-savvy, more open to app-based solutions, interface must be simple and mobile-friendly for ease of use

Conclusion

BashayJabo will be a ride-sharing system for IUT students that connects with services like Uber or public transport. Using SDLC, it will ensure a reliable, user-friendly solution that supports creating or joining rides, while considering student needs, safety, and cost.

Thank you!

Welcoming any and all questions
